H. Hunt Batjer, MD, Edward C. Benzel, MD**

**Publication date: October 2012**

Neurosurgery represents the focal point of a multitude of medical, radiological, and surgical areas of expertise. Today, more than ever, patients with neurological disorders are treated by teams of physicians working together to enhance quality of life. As we focus upon patient-oriented outcomes, it is essential that all specialists understand and apply the evidence in order to promote quality care.

For the first time, a single textbook aims to bring together the evidence in order to illuminate the most challenging facets of neurosurgical practice today. These include, but are clearly not limited to:

- to fuse or not to fuse the degenerative lumbar spine;
- surgical and/or endovascular treatments for brain aneurysm;
- surgery, radiation, and/or medical-immunological therapies for brain tumors.

This textbook represents the collaborative work of preeminent leaders in the field. The information has been organized to help physicians-in-training, neurologists, neurological surgeons, radiation oncologists, and medical doctors to stay informed, to prepare for board examinations and for maintenance of certification requirements. In addition, each topic has been thoroughly reviewed to provide the practicing neurological surgeon with an invaluable resource to enhance the delivery of 'best practice' to patients with neurosurgical disorders.

GBP £75; USD \$150; EUR € 115; hardback; 504pp; ISBN: 978 1 903378 79 3
